

What is claimed is:

1. A switching power source apparatus comprising:

a switching output circuit for outputting a DC output voltage converted from a DC power source voltage by a semiconductor switch which is on-off controlled;

5 error amplifying means for comparing said DC output voltage with a reference voltage to generate a feedback signal which decreases as said DC output voltage increases;

a current detecting circuit for detecting an output current flowing through said switching output circuit to
10 generate a current detecting signal which decreases as said output current increases; and

a PWM comparator, to which said feedback signal and said current detecting signal are inputted as comparison signals and a triangular wave signal is inputted as a
15 reference signal, for comparing a lower signal of said comparison signals and said triangular wave signal to output a PWM signal,

wherein said semiconductor switch is on-off controlled by said PWM signal.

20

2. The switching power source apparatus according to claim 1,

wherein said current detecting signal is outputted

through a low-pass filter.

3. The switching power source apparatus according to claim 2,

5 wherein said low-pass filter includes:

a resistor provided between an input side and an output side;

a capacitor between said output side and a reference point; and

10 a semiconductor switch for charge discharging, which is connected in parallel to said capacitor, to be turned on when a voltage on the input side becomes lower than a voltage on the output side.
